Background	macrophage migration inhibitory factor (glycosylation-inhibiting factor)(MIF) Homo sapiens This gene encodes a lymphokine involved in cell-mediated immunity, immunoregulation, and inflammation. It plays a role in the regulation of macrophage function in host defense through the suppression of anti-inflammatory effects of glucocorticoids. This lymphokine and the JAB1 protein form a complex in the cytosol near the peripheral plasma membrane, which may indicate an additional role in integrin signaling pathways. Other	MIF, Macrophage migration inhibitory factor
