| Background | NFKB repressing factor(NKRF) Homo sapiens This gene encodes a transcriptional repressor that interacts with specific negative regulatory elements to mediate transcriptional repression of certain nuclear factor kappa B responsive genes. The protein localizes predominantly to the nucleolus with a small fraction found in the nucleoplasm and cytoplasm. Alternate splicing results in multiple transcript variants. | Other | NKRF ITBA4 NRF, NF-kappa-B-repressing factor (NFKB-repressing factor) (Protein ITBA4) (Transcription factor NRF) |
