<b>Background</b>	<p>NME/NM23 nucleoside diphosphate kinase 1(NME1) Homo sapiens This gene (NME1) was identified because of its reduced mRNA transcript levels in highly metastatic cells. Nucleoside diphosphate kinase (NDK) exists as a hexamer composed of &amp;Apos;A&amp;Apos; (encoded by this gene) and &amp;Apos;B&amp;Apos; (encoded by NME2) isoforms. Mutations in this gene have been identified in aggressive neuroblastomas. Two transcript variants encoding different isoforms have been found for this gene. Co-transcription of this gene and the neighboring downstream gene (NME2) generates naturally-occurring transcripts (NME1-NME2), which encodes a fusion protein comprised of sequence sharing identity with each individual gene product. <b>Other</b>	NME1, Nucleoside diphosphate kinase A
