Background	6-phosphofructo-2-kinase/fructose-2,6-bisphosphatase 1(PFKFB1) Homo sapiens This gene encodes a member of the family of bifunctional 6-phosphofructo-2-kinase:fructose-2,6-bisphosphatase enzymes. The enzyme forms a homodimer that catalyzes both the synthesis and degradation of fructose-2,6-bisphosphate using independent catalytic domains. Fructose-2,6-bisphosphate is an activator of the glycolysis pathway and an inhibitor of the gluconeogenesis pathway. Consequently, regulating fructose-2,6-bisphosphate levels through the activity of this enzyme is thought to regulate glucose homeostasis. Multiple alternatively spliced transcript variants have been found for this gene. [provided by RefSeq, Nov 2012],
Other	PFKFB1/PFKFB4, 6-phosphofructo-2-kinase/fructose-2,6-bisphosphatase 1/4
