<b>Background</b>	polyribonucleotide nucleotidyltransferase 1(PNPT1) Homo sapiens The protein encoded by this gene belongs to the evolutionary conserved polynucleotide phosphorylase family comprised of phosphate dependent 3'-5' RNA exonucleases implicated in RNA processing and degradation. This enzyme is predominantly localized in the mitochondrial intermembrane space and is involved in import of RNA to mitochondria. Mutations in this gene have been associated with combined oxidative phosphorylation deficiency-13 and autosomal recessive nonsyndromic deafness-70. Related pseudogenes are found on chromosomes 3 and 7. [provided by RefSeq, Dec 2012],
<b>Other</b>	PNPT1, Polyribonucleotide nucleotidyltransferase 1 mitochondrial
