<b>Background</b>	RAB, member of RAS oncogene family-like 2A(RABL2A) Homo sapiens This gene is a member of the RAB gene family which belongs to the RAS GTPase superfamily. The proteins in the family of RAS-related signaling molecules are small GTP-binding proteins that play important roles in the regulation of exocytotic and endocytotic pathways. This gene maps to the site of an ancestral telomere fusion event and may be a subtelomeric gene. Alternative splicing results in multiple transcript variants encoding different isoforms. <b>Other</b>	RABL2A, Rab-like protein 2A
