Background	SATB homeobox 2(SATB2) Homo sapiens This gene encodes a DNA binding protein that specifically binds nuclear matrix attachment regions. The encoded protein is involved in transcription regulation and chromatin remodeling. Defects in this gene are associated with isolated cleft palate and mental retardation. Alternate splicing results in multiple transcript variants that encode the same protein. [provided by RefSeq, Feb 2010],
Other	SATB2 KIAA1034, DNA-binding protein SATB2 (Special AT-rich sequence-binding protein 2)
