Background	TNF receptor superfamily member 21(TNFRSF21) Homo sapiens This gene encodes a member of the tumor necrosis factor receptor superfamily. The encoded protein activates nuclear factor kappa-B and mitogen-activated protein kinase 8 (also called c-Jun N-terminal kinase 1), and induces cell apoptosis. Through its death domain, the encoded receptor interacts with tumor necrosis factor receptor type 1-associated death domain (TRADD) protein, which is known to mediate signal transduction of tumor necrosis factor receptors. Knockout studies in mice suggest that this gene plays a role in T-helper cell activation, and may be involved in inflammation and immune regulation. [provided by RefSeq, Jul 2013],
Other	TNFRSF21 DR6 UNQ437/PRO868, Tumor necrosis factor receptor superfamily member 21 (Death receptor 6) (CD antigen CD358)
