Background	adenylate cyclase 4(ADCY4) Homo sapiens This gene encodes a member of the family of adenylate cyclases, which are membrane-associated enzymes that catalyze the formation of the secondary messenger cyclic adenosine monophosphate (cAMP). Mouse studies show that adenylate cyclase 4, along with adenylate cyclases 2 and 3, is expressed in olfactory cilia, suggesting that several different adenylate cyclases may couple to olfactory receptors and that there may be multiple receptor-mediated mechanisms for the generation of cAMP signals. Alternative splicing results in transcript variants. [provided by RefSeq, Nov 2010],
Other	ADCY4, Adenylate cyclase type 4;ATP pyrophosphate-lyase 4; Adenylate cyclase type IV; Adenylyl cyclase 4
