<b>Background</b>	peptidylprolyl isomerase B(PPIB) Homo sapiens The protein encoded by this gene is a cyclosporine-binding protein and is mainly located within the endoplasmic reticulum. It is associated with the secretory pathway and released in biological fluids. This protein can bind to cells derived from T- and B-lymphocytes, and may regulate cyclosporine A-mediated immunosuppression. Variants have been identified in this protein that give rise to recessive forms of osteogenesis imperfecta. [provided by RefSeq, Oct 2009],
<b>Other</b>	PPIB, Peptidyl-prolyl cis-trans isomerase B
