Background	gelsolin(GSN) Homo sapiens The protein encoded by this gene binds to the "plus" ends of actin monomers and filaments to prevent monomer exchange. The encoded calcium-regulated protein functions in both assembly and disassembly of actin filaments. Defects in this gene are a cause of familial amyloidosis Finnish type (FAF). Multiple transcript variants encoding several different isoforms have been found for this gene. [provided by RefSeq, Jul 2008],
Other	GSN, Gelsolin (AGEL) (Actin-depolymerizing factor) (ADF) (Brevin)
