<b>Background</b>	<p>hepatocyte nuclear factor 4 alpha(HNF4A) Homo sapiens The protein encoded by this gene is a nuclear transcription factor which binds DNA as a homodimer. The encoded protein controls the expression of several genes, including hepatocyte nuclear factor 1 alpha, a transcription factor which regulates the expression of several hepatic genes. This gene may play a role in development of the liver, kidney, and intestines. Mutations in this gene have been associated with monogenic autosomal dominant non-insulin-dependent diabetes mellitus type I. Alternative splicing of this gene results in multiple transcript variants encoding several different isoforms. [provided by RefSeq, Apr 2012],</p>		
<b>Other</b>	HNF4A/HNF4G, Hepatocyte nuclear factor 4-alpha/gamma
